

TOTAL APPROACH AT A 'GREENFIELD' BREWERY

SECTOR

8 generations of Belgian craftsmanship and a passion for beer have led to a reputation of being the most ultra-modern brewery with the lowest CO2 emissions in the world, with an export of 85% to more than 100 countries. Innovations in new technologies, processes and products and long-lasting collaborations are therefore central focus points in their daily activities, with their artistic origins as their heritage.

CHALLENGE

The unanimous satisfaction at one site also gave Tensio the opportunity to work together with the other site, a 'Greenfield' state of the art brewery, in order to analyse and optimise the efficiency of the cleaning processes and the infrastructure.

SOLUTION

Tensio realised **the entire project from chemicals storage to providing advice regarding CIP programmes** together with them: the chemicals storage in an area with double-walled tanks was fully developed, an adjusted unloading system was commissioned and live stock monitoring was implemented.

The **complete range of products** was also reviewed and adjusted in line with the needs set by the renewed cleaning processes.

RESULT

The Greenfield project is **a major success**.

No problems have been identified since the start of our collaboration. The retesting of the storage tanks forms part of our control and has been running smoothly for years. Invoicing is done based on a fixed price per hectolitre of beer.

Innovation, courage and trust have resulted in this extraordinary collaboration.
